

# AWS

## 1) Deploy an application across multiple Availability Zones for high availability:-

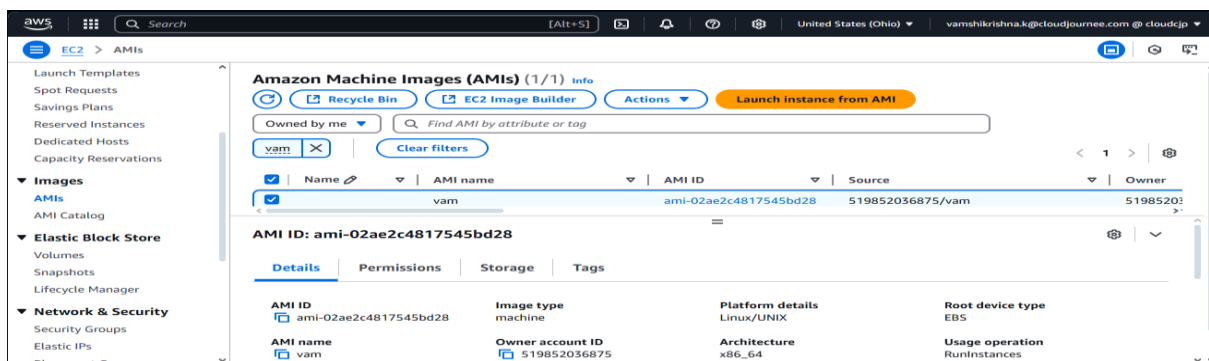

- Create an instance and deploy httpd application on it and allow http ports in security group.

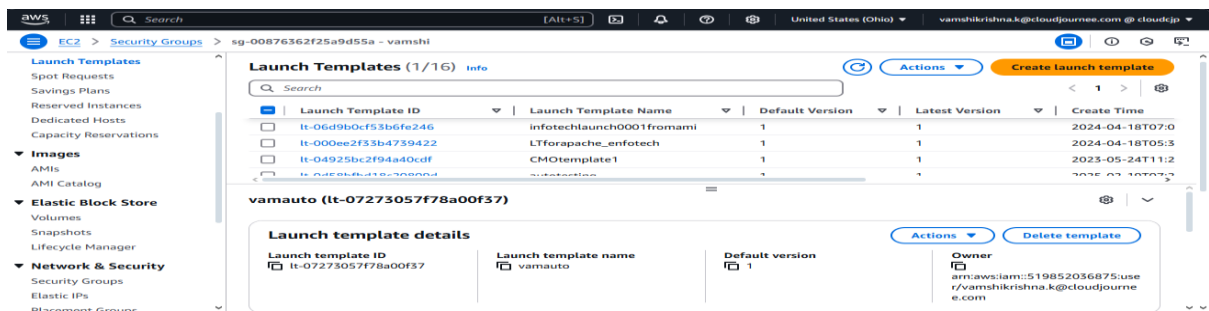

Its working

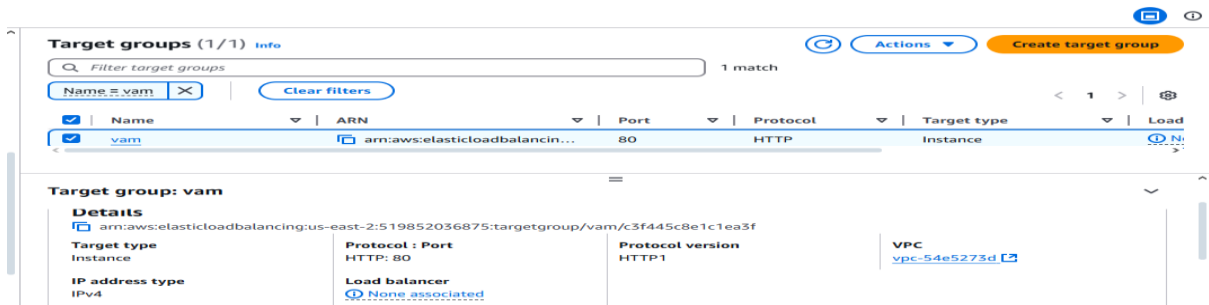

Created Ami

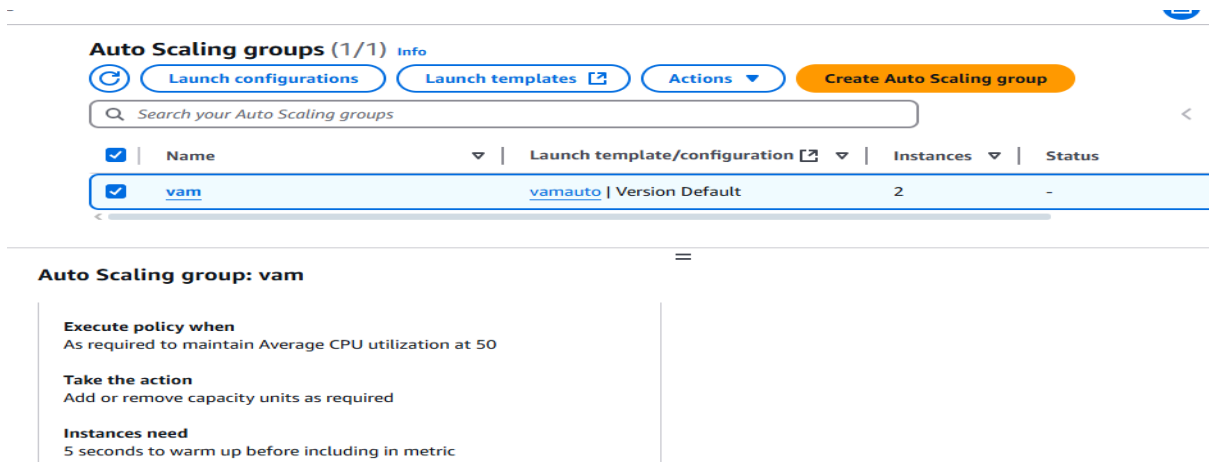

Created a launch template using ami

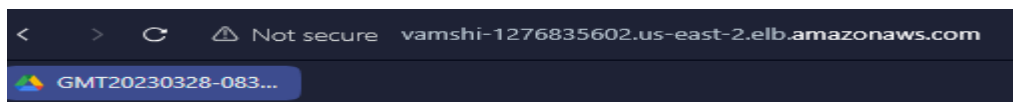

Created a load balancer in the same vpc and created a target groups

Created a autoscalling group by using the launch template ,load balancer and target groups created initially and added a policy.

The dns of load balancer is working

centralized server
